Description:	Modular prewired switch with roller plunger	Page:	4/4

Installation of single switches with safety functions

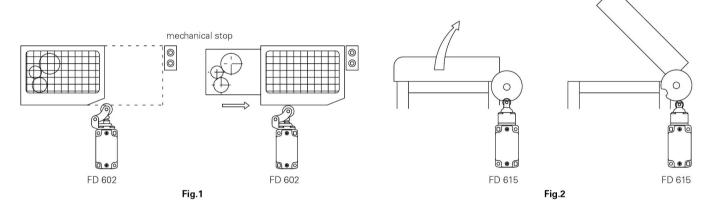

- Use only switches with the symbol \bigcirc
- Connect the safety circuit to the NC normally closed contacts (11-12, 21-22 or 31-32).
- The NO normally open contacts (13-14, 23-24, 33-34) should be used only for signalling; these contacts are not to be connected with the safety circuit. However, if two or more switches are used on the same guard, a connection can be established between the NO contacts and the safety circuit.

In this case at least one of the two switches must have positive opening and a normally closed contact NC (11-12, 21-22 or 31-32) must be connected to the safety circuit.

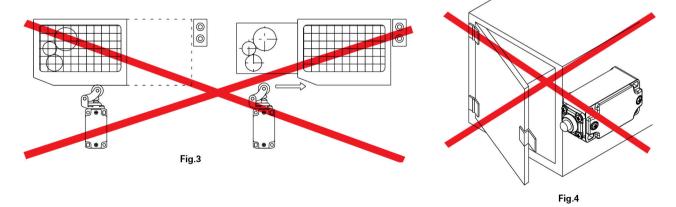

- Actuate the switch at least up to the positive opening travel shown in the travel diagrams with symbol \bigcirc .
- The actuation system must be able to exert a force that is greater than the positive opening force, as specified in brackets below each article, next to the minimum force value.
- The device must be affixed in compliance with EN ISO 14119.

Whenever the machine guard is opened and during the whole opening travel, the switch must be pressed directly (fig. 1) or through a rigid connection (fig. 2).

Only in this way the positive opening of the normally closed NC contacts (11-12, 21-22, 31-32) is guaranteed.

In safety applications with only one switch for each guard, the switches must never be activated by a release (fig. 3 and 4) or through a non rigid connection (i.e. by a spring).
